CHOLERA GENOMIC SURVEILLANCE IN LEBANON

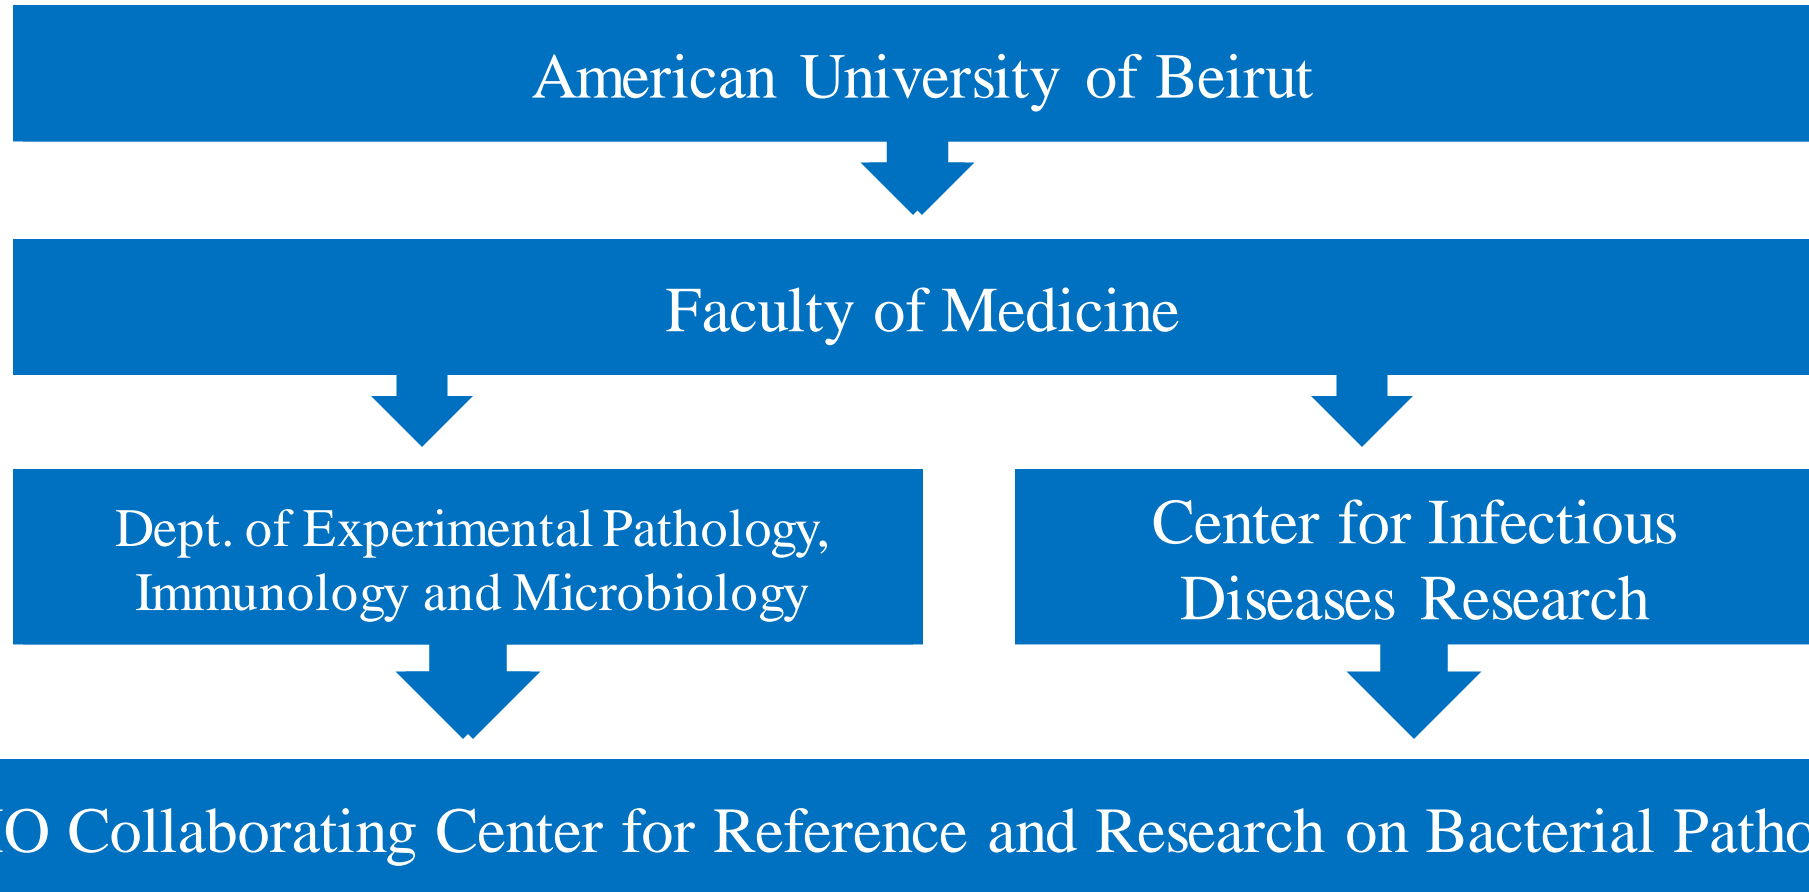

Dr. Ghassan M. Matar

Director, WHO Collaborating Center for Reference and Research on Bacterial Pathogens

Chairperson & Professor Department of Experimental Pathology, Immunology and Microbiology (EPIM)

Co-Director Center for Infectious Diseases Research (CIDR)

Organizational Structure

Objectives of Laboratory Testing for Cholera

- Timely, accurate, and reliable laboratory results are critical for detecting cases and confirm outbreaks of cholera that may spread rapidly if not contained.
- The objectives of the laboratory diagnosis of cholera include:
 - Confirming alerts and declaring outbreaks
 - Monitoring antibiotic susceptibility
 - Characterizing the circulating strains
 - Identifying changes in the virulence
 - Supporting epidemiologic investigations
 - Declaring the end of an outbreak.
- At least one laboratory in the country should be operational and capable of isolating and identifying *Vibrio cholerae* by culture -or PCR if available- and performing antibiotic susceptibility testing in the country.
- The designated reference laboratory should ensure provision of transport media and reagents, training of technicians and monitoring the quality of examinations.

Laboratory Tests for Cholera

- **Traditional Phenotypic Detection Methods of *Vibrio cholerae***
 - **RDTs & Culture**

- **Traditional Molecular Detection Methods of *Vibrio cholerae***
 - **Nested Multiplex PCR Panels**

- **Biotyping**

- **Antimicrobial Susceptibility Testing**

- **Traditional & Advanced Genotyping Methods**
 - **Pulsed-field Gel Electrophoresis (PFGE)**
 - **Whole Genome Sequencing (WGS)**

Traditional Detection Methods

Example: *Vibrio cholerae*

- Rapid diagnostic kits for *V. cholera* identification are available

CRYSTAL[®] VC RAPID DIAGNOSTIC TEST (RDT)

U.S. Department of
Health and Human Services
Centers for Disease
Control and Prevention

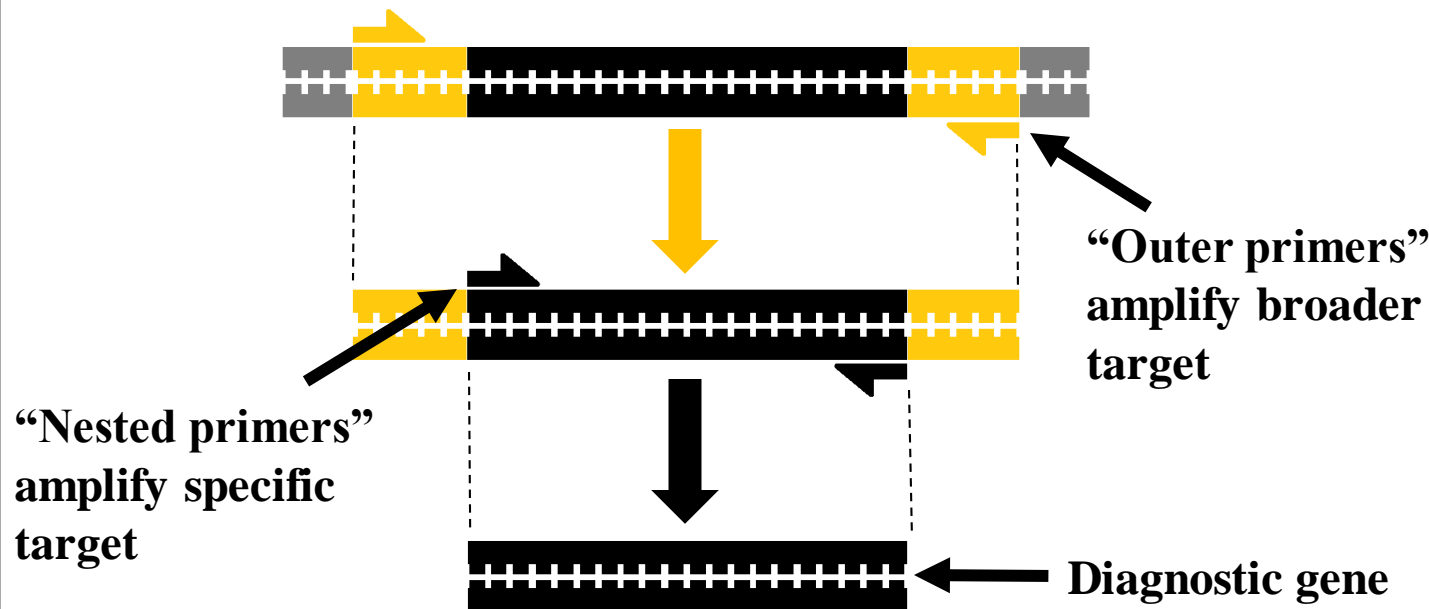

- Utilizes **nitrocellulose strips coated with anti-O1 and anti-O139 antibodies**
- Provides a result within **15-30 minutes** directly **from patient stool sample**
- Can be performed **on site** in the field during an outbreak
- Identifies **toxigenic V. cholerae** serogroups **O1 and O139**

Traditional Molecular Techniques

Multiplex Nested PCR:

- **Genomic DNA** of infecting pathogens can be **extracted directly** from the patient sample
- **Detection of diagnostic genes** using **Simplex Nested PCR** can **identify** the infecting **pathogen**

- Applying **Multiplex Nested PCR** would identify **several pathogens** in a **single PCR run**
- This **highly sensitive identification** process requires **less than 24hrs**

CHOLERA SURVEILLANCE IN --- LEBANON

Culture on TCBS

Example: *Vibrio cholerae*

- **Traditional isolation** of *V. cholerae* from fecal specimens involves several steps

Culture in AUB Bacteriology and Molecular Microbiology Lab EPIM WHO CC

Cholera Surveillance Report

24 Jan 2023

Call Centers
 1760 (Red Cross)
 1787 (MOPH)

All cases (suspected and confirmed)		Confirmed Cases		Deaths (confirmed)	
New (past 24 h)	Cumulative	New (past 24 h)	Cumulative	New	Cumulative
13	6268	0	671	0	23

By Sex
(suspected and confirmed)

Occupied hospital beds
(suspected and confirmed)

By date of report
(suspected and confirmed)

By Hospital Admission
(suspected and confirmed)

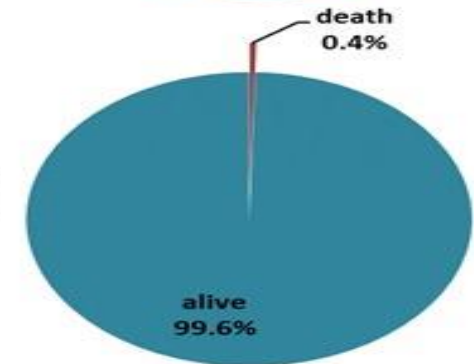

By locality (confirmed cases)

By age group
(suspected and confirmed cases)

By Outcome
(suspected and confirmed)

Antimicrobial Susceptibility Testing

- We have so far completed the Antimicrobial Susceptibility testing using **disc diffusion (DD)** assay that was validated with **broth microdilution (BMD)** assay on 68/300 pure cultures showing *Vibrio cholerae* isolates.
- Both susceptibility tests were repeated 3 times and they were reproducible and results matched. Phenotypic tests results matched also genotypic results.

Antimicrobial Susceptibility Testing

Sample ID	AST														
	Cefotaxime	Ceftazidime	Piperacillin/tazobactam	Meropenem	Nalidixic acid	Pefloxacin	Ciprofloxacin	Levofloxacin	Erythromycin	Azithromycin	prim-sulfamet	Tetracycline	Doxycycline	O129	Nitrofurantoin

S14	S	S	S	R	R	R	I	I	S	S	S	S	S	R	R

Antimicrobial Susceptibility Testing

- **Azithromycin** would be for now the main recommendation if available.
- If *V. cholerae* proved to be sensitive to doxycycline it would be helpful (as it can be treated with a single dose). Doxycycline testing is another option.

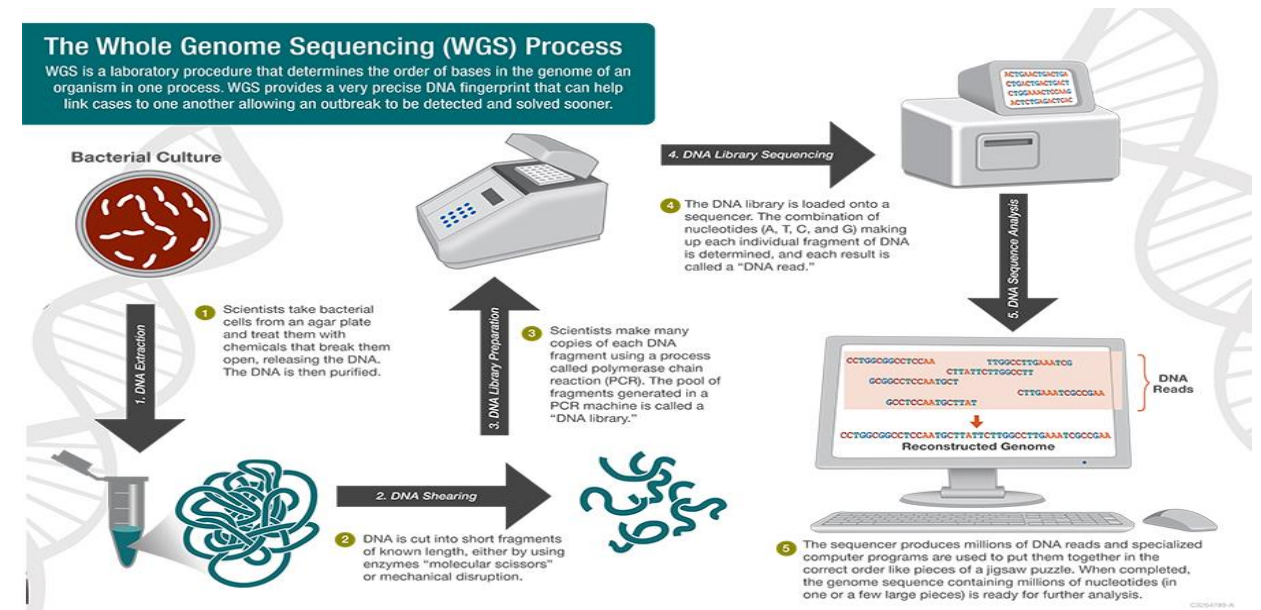

GENOMIC SURVEILLANCE IN LEBANON

- Capable of the concurrent **detection and full characterization** of *Vibrio spp.*
- Relies on **genomic DNA** extracted from bacterial isolate
- Identifies serogroups, biotypes, virulence determinants, antimicrobial resistance genes, and the presence of plasmid and/or bacteriophages in **a single run**
- Provides the **highest resolution** genomic typing method that can compare **samples to source** as well as construct **phylogenetic trees**

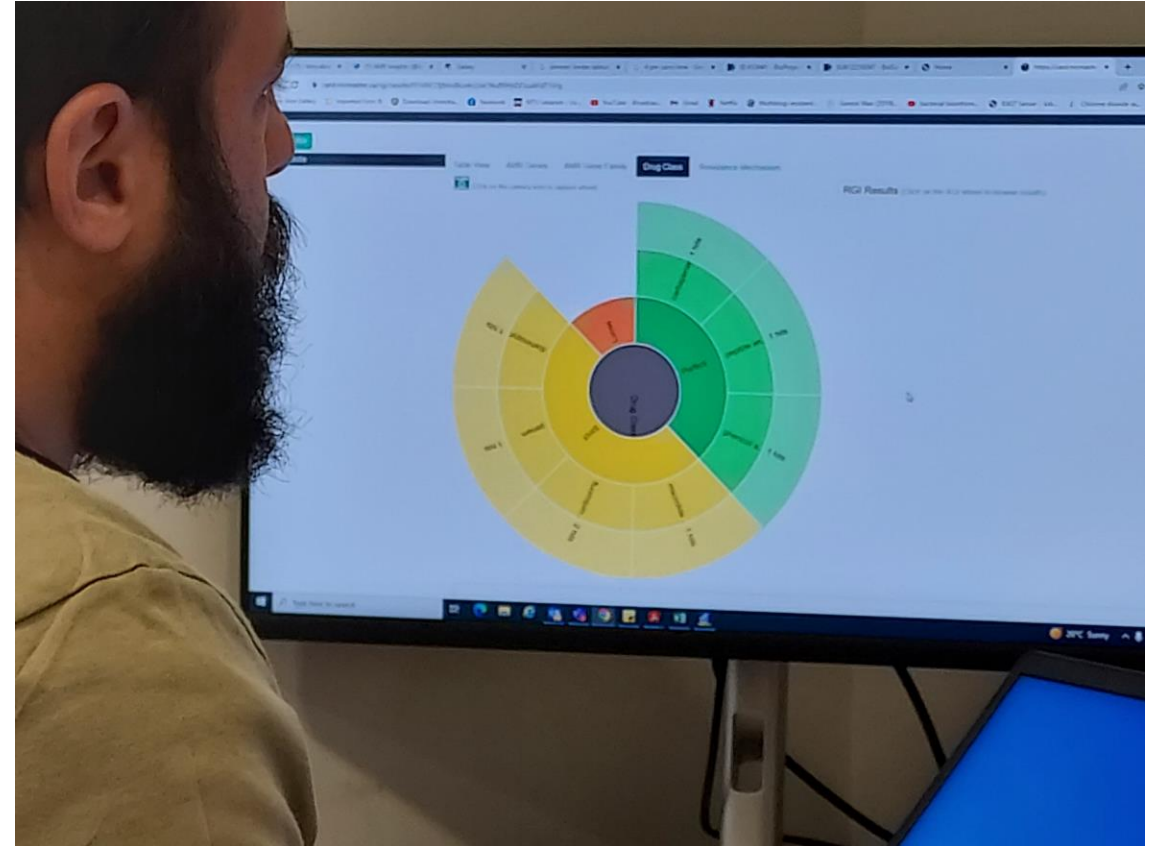

Whole Genome Sequencing (WGS)

- The future of laboratory-based surveillance of microbes implicated in disease outbreaks
